Background

- Games are a huge market (billions of worth, countless hours spent)
- Changing the entertainment landscape, overtaking music and movies
- Large industry, with lots of technical innovation and inspiring work

Beyond entertainment

- The success of games is inspiring more and more people
- What if we can make other stuff as engaging?
- And so, serious games are born

Serious games

- Using game mechanics to bring serious applications to life
- Simulators, training applications, rehabilitation, school, and much more
- Countless applications could benefit from games, accelerating progress and culture from many angles

What is stopping us?

- Great, so where is my "learn math by blowing zombies up" game?
- Serious games makers do not have huge resources
- Here comes the problem: games are very hard and expensive to build

What is stopping us?

- Great, so where is my "learn math by blowing zombies up" game?
- Serious games makers do not have huge resources
- Here comes the problem: games are very hard and expensive to build
- This heavily impacts the viability of games in such innovative applications

Our take

- Our goal is to study and optimize the technical aspects of game development
- We look for complexity in the process and try to automate it
- We focus on the programming languages side of the equation^a

^aThere are many others!

The game loop - a source of complexity

- Games need to run in real time
- \bullet Frames must be sent to the screen at 30/60Hz
- It's all a big loop!

A very simplified game architecture

The game loop - a source of complexity

- update covers the dynamics of the game
- The game is a hybrid system
- The continuous parts are simple: just integrate numerically (P = P + V * dt)
- The discrete parts are less simple: large concurrent state machines!

Idea

- Most of what makes a game a game is the discrete part of the dynamics
- Create interesting patterns that introduce controlled variation
- These dynamics define game logic, AI, and more

Idea

- We will now present Casanova, a domain specific language (DSL) for game development
- The language has time as a first class primitive
- All computations are specified as transformations of the state
- Continuous and discrete dynamics are both directly supported

- We have been eating our own dog food quite extensively :)
- We have built a lot of samples and smaller games with Casanova
